Abstract:

Infants are highly sensitive to variations in environmental temperature and require continuous monitoring to maintain a safe and comfortable thermal environment. Conventional baby monitoring methods largely depend on manual supervision, which may not provide continuous monitoring or immediate response to abnormal conditions. The proposed system employs a temperature sensor interfaced with an ESP32/ESP8266 microcontroller to continuously acquire ambient temperature data. The measured parameters are processed and transmitted through Wi-Fi to an IoT platform, where they can be monitored remotely using a web or mobile-based interface. A predefined temperature range is established, and the system automatically controls a cooling fan or heating element whenever the measured temperature exceeds or falls below the specified limits. In addition, the system can generate real-time alerts to notify caregivers about abnormal temperature conditions. To provide comprehensive infant monitoring, the proposed framework can be extended with diaper wetness detection, baby cry detection with automatic cradle swinging, and live video surveillance using an ESP32-CAM. The collected sensor data can be stored and visualized through the IoT platform, enabling continuous observation and analysis of environmental conditions. monitoring compared with conventional manual methods.

IoT Cloud, Smart Cradle.

1. INTRODUCTION

The rapid development of the Internet of Things (IoT) has enabled the integration of sensors, microcontrollers, wireless communication, cloud platforms, and intelligent control systems for real-time healthcare applications. Infant monitoring is an important area where IoT technology can improve safety and caregiver convenience. Newborn babies are particularly sensitive to environmental temperature variations because their thermoregulatory mechanisms are not fully developed. Therefore, maintaining a suitable and stable temperature around the baby is essential for ensuring comfort and reducing the risk associated with excessive heat or cold. Such monitoring may be difficult when caregivers are sleeping, working, or away from the baby. Existing electronic monitoring systems can provide temperature readings and alerts, but many systems primarily focus on detecting abnormal conditions rather than automatically correcting them. This research proposes an IoT-Based Smart Baby Temperature Maintaining and Monitoring System using a temperature sensor, ESP32/ESP8266 microcontroller, Wi-Fi connectivity, and automatic heating and cooling mechanisms. The sensor continuously measures the ambient temperature and sends the readings to the microcontroller for processing. The measured value is compared with predefined temperature limits. If the temperature rises above the specified range, a cooling fan is automatically activated, whereas a heating device is activated when the temperature falls below the required range. Once the temperature returns to the desired range, the corresponding control device is automatically switched off. The system also provides remote monitoring and real-time alerts through an IoT platform. Temperature readings and system status can be displayed on a web or mobile dashboard, allowing caregivers to monitor the baby's environment from a remote location. Abnormal temperature conditions can generate immediate notifications, enabling caregivers to take appropriate action when necessary. The collected data can also be stored for monitoring temperature variations and evaluating system performance. To provide more comprehensive infant care, the proposed framework can be extended with additional features such as diaper wetness detection, baby cry detection with automatic cradle swinging, and live video monitoring using an ESP32-CAM. These features can improve the overall functionality of the system by combining environmental monitoring, automated response, and remote visual observation. The proposed IoT-based approach is designed to be low-cost, scalable, and suitable for smart-home and infant-care applications. Overall, the system demonstrates the potential of IoT and embedded technologies to provide continuous, automated, and remote infant.

2. LITERATURE SURVEY

M. E. Akbiyik et al. (2020) [1]: Developed “ThermoCam: Smart Baby Monitoring Assistant” using thermal imaging, RGB cameras, IoT communication, and environmental sensors. The system monitored infant body temperature, room temperature, humidity, and noise and provided real-time alerts to caregivers. This work demonstrates the importance of combining visual and

environmental monitoring for infant safety.

W. Shalannanda et al. (2020)[2]: Proposed an IoT-Based Infant Incubator Monitoring System using Arduino technology. The system monitored temperature, humidity, and physiological parameters of newborns and transmitted the collected information through IoT. The research provides a foundation for automated environmental monitoring in baby-care systems.

W. Shalannanda et al. (2020)[3]: Implemented a hardware module for an IoT-based infant incubator capable of monitoring pulse rate, oxygen saturation, temperature, and humidity. The system demonstrated how multiple sensors can be integrated with a microcontroller to provide continuous neonatal monitoring and remote access to health-related information.

F. Fahmi et al. (2020)[4]: Developed an IoT-Based Smart Incubator That Listens to the Baby, incorporating baby-cry detection with environmental monitoring. The system can identify crying conditions and support automatic responses while allowing remote monitoring. This study is particularly relevant to the proposed system's baby cry detection and automatic cradle swing feature.

D. B. Zimmer et al. (2020)[5]: Presented a study on the Design, Control, and Simulation of a Neonatal Incubator, focusing on precise temperature, humidity, and airflow control. The research demonstrated the importance of feedback-based environmental control for maintaining suitable conditions for newborns.

H. M. Ishtiaq Salahin et al. (2021)[6]: Proposed an IoT-Based Smart Baby Monitoring System with Face Recognition. The system combined IoT sensors, camera-based monitoring, face recognition, and cloud connectivity to improve infant safety. The study highlights the usefulness of visual monitoring along with sensor-based information.

R. M. Abd El-Aziz and A. I. Taloba (2021)[7]: Developed a Real-Time Monitoring and Control of Neonatal Incubator Using IoT system. The proposed system monitored temperature, humidity, gas leakage, pulse rate, and oxygen levels and transmitted the information to healthcare professionals. The research demonstrates the potential of IoT for continuous monitoring and automatic control of infant-care environments.

R. Sundarajoo et al. (2022)[8]: Proposed a Remote Baby Surveillance System with RFID and GPS Tracking that monitored infant temperature, mattress wetness, crying, and movement while providing location tracking and remote notifications. This work is closely related to the proposed system's diaper wetness detection, cry detection, and remote monitoring capabilities.

P. Kumar and S. Singh (2023)[9]: Investigated IoT-based monitoring systems with an emphasis on low-power operation and renewable energy integration. The study demonstrated that sensor-based monitoring devices can operate for extended periods using efficient power-management techniques. This concept can be applied to improve the energy efficiency of smart baby monitoring systems.

Recent IoT-based baby monitoring research (2023–2025)[10]: Several systems have increasingly integrated temperature sensors, humidity sensors, moisture sensors, microphones, cameras, wireless communication, and cloud dashboards to provide comprehensive infant monitoring. These developments indicate a shift from individual sensor monitoring toward integrated smart-care platforms capable of both monitoring and automatic response.

3. PROPOSED METHODOLOGY

Figure1: Block Diagram of Smart Baby Maintenance and Monitoring System

The IoT-Based Smart Baby Cradle Monitoring System with Live Camera is designed to provide a comprehensive solution for infant safety, health monitoring, and parental convenience by integrating embedded systems, Internet of Things (IoT) technology, sensors, automation, and wireless communication. The methodology adopted for this project focuses on continuously monitoring the baby's condition, automatically responding to abnormal situations, and providing real-time information to parents through a web-based monitoring system. The proposed methodology combines multiple sensing devices with intelligent control mechanisms to create an affordable and efficient smart baby cradle suitable for homes, hospitals, and daycare centers.

The development methodology begins with identifying the major problems associated with conventional baby monitoring systems. Traditional cradles require continuous supervision by

parents or caregivers and cannot automatically detect conditions such as diaper wetness, excessive crying, or uncomfortable room temperature. These limitations may lead to delayed responses, discomfort, and health issues for infants. To overcome these challenges, the proposed system integrates multiple sensors and automation techniques capable of monitoring various environmental and infant-related parameters simultaneously.

The system architecture consists of two major processing units: the Arduino Uno and the ESP32CAM. The Arduino Uno serves as the primary controller responsible for collecting sensor data, processing the inputs, and controlling output devices such as the servo motor and cooling fan. The ESP32-CAM independently handles live video streaming over Wi-Fi, allowing parents to monitor the baby's activities remotely through a web browser. This separation of processing tasks improves system performance and reliability while reducing the workload on the microcontroller.

The methodology starts with sensor data acquisition. Different sensors are installed on the baby cradle to monitor specific parameters continuously. A moisture sensor is placed beneath the baby's diaper to detect diaper wetness. A sound sensor is positioned near the cradle to detect the baby's crying. A DHT11 temperature and humidity sensor continuously measures the surrounding environmental conditions. Each sensor generates electrical signals that are transmitted to the Arduino Uno for processing.

After acquiring sensor data, the Arduino performs data processing and decision-making. The microcontroller compares each sensor reading with predefined threshold values stored in its program memory. If the diaper moisture level exceeds the allowable limit, the Arduino identifies that the diaper is wet and immediately generates an alert. Similarly, if the sound sensor detects crying above the threshold level, the controller interprets the sound as infant crying and activates the cradle swinging mechanism. In the case of environmental monitoring, if the room temperature exceeds the predefined safe value, the Arduino automatically switches ON the cooling fan through a relay module.

One of the important features of the proposed methodology is automatic cradle swinging. Crying is one of the primary methods through which infants express hunger, discomfort, or pain. Immediate parental attention may not always be possible due to household activities or professional commitments. Therefore, the proposed system uses a servo motor to gently swing the cradle whenever crying is detected. The swinging motion helps calm the baby naturally while simultaneously notifying the parents through the monitoring website. If the crying continues for an extended period, caregivers can observe the baby using the live video feed and take appropriate action.

4. CONCLUSION

The IoT-Based Smart Baby Maintenance and Monitoring System provides an integrated and automated solution for continuous baby care and supervision. The proposed system combines temperature and humidity monitoring, diaper wetness detection, baby cry detection, automatic

cradle swinging, temperature-based fan control, and ESP32-CAM live video monitoring into a single platform.

The ESP32 microcontroller acts as the main processing and control unit. It receives information from the connected sensors, processes the readings, and takes appropriate control actions. When the surrounding temperature increases beyond the predefined limit, the fan is automatically activated to maintain a comfortable environment. Similarly, when the acoustic sensor detects baby crying, the system can activate the cradle swing for a specified period. The diaper moisture sensor helps identify a wet diaper and provides an indication to the caregiver.

The ESP32-CAM provides live visual monitoring, allowing parents or caregivers to observe the baby remotely. Sensor readings and device conditions are displayed through the IoT web dashboard, including temperature, humidity, diaper status, baby acoustic status, fan status, cradle status, and live video. This enables caregivers to understand the baby's condition without continuously being physically present near the cradle.

The system also reduces manual effort and response time by providing automatic actions for common baby-care requirements. Continuous sensor monitoring helps identify changes in the baby's surrounding environment, while alerts and dashboard information assist caregivers in taking timely action.

The proposed system demonstrates that IoT and embedded technology can be effectively applied to smart baby-care applications. By integrating monitoring, automation, communication, and video surveillance, the system provides a convenient and efficient platform for improving baby comfort and caregiver awareness.

In future development, the system can be enhanced by adding heart-rate and SpO₂ sensors, advanced cry classification using machine learning, mobile notifications, cloud-based data storage, sleep monitoring, voice alerts, and AI-based abnormal-condition detection. These improvements can make the system more intelligent, reliable, and suitable for advanced smart-home and healthcare applications.

323. Mahadev, M., Rahulkumar, D. R., & Shirkande, D. (n.d.). Efficient routing and data fusion in IoT-WSNs for resilient forest fire monitoring.
324. Mr. Zade Mahesh Mahadev published a paper in International Journal of Artificial Intelligence and Machine Learning on “An Iot-Enabled Resilient Wireless Sensor Network Framework For Early Forest Fire Detection And Monitoring” June 2026(SCOPUS)
325. Mr. Zade Mahesh Mahadev published a paper in International Journal of Artificial Intelligence and Machine Learning on “A Reliable, Energy-Efficient And Secure Data Aggregation Framework For Resource Constrained Wireless Sensor Networks” June 2026(SCOPUS)

326. Mr. Zade Mahesh Mahadev published a paper in Shodhkosh-Journal of Visual & Performing Arts on “Visualizing Forest Fire Risks: An Efficient and Resilient IoT-Enabled Wireless Sensor Network Approach” March 2026
327. Mr. Zade Mahesh Mahadev published a paper in Shodhkosh-Journal of Visual & Performing Arts on “The Aesthetics of Data Flow: Enhancing Reliability and Efficiency in Resource-Constrained Wireless Sensor Networks” March 2026
328. Mr. Zade Mahesh Mahadev published a paper in Anveshana’s International Journal of Research in Engineering and Applied Sciences on “EFFICIENT ROUTING AND DATA FUSION IN IOT-WSNS FOR RESILIENT FOREST FIRE MONITORING” AIJREAS VOLUME 10, ISSUE 9 (2025, SEP) (ISSN-2455-6300) ONLINE
329. Mr.M.M.Zade Presented the Paper on “Touchless Fingerprint Recognition System” (Paper-ID 907) in International Conference on “Advanced Technologies for Societal Applications: Techno-Societal 2022 organized by Shri Vithal Education & Research Institute(SVERI), Pandharpur from 9th December 2022 to 10th December 2022.
